Overview

**WARNING**
Always shut down the vehicle when working around the steering axle or pivot point when installing or adjusting the Wheel Angle Sensor components. The steering mechanism could move suddenly and unexpectedly and cause severe injury or death.

These instructions provide the procedure for installing the Wheel Angle Sensor on the supported vehicles listed. The Wheel Angle Sensor sends feedback to the AutoSteer system to give it the relative position of the steering axle, pivot point, or other steering mechanism so the AutoSteer system can better predict how far and fast to turn.

**Note:** This installation requires the installer to cut the standard length of rods to specific lengths to work on the vehicle. This manual provides suggested cut lengths and final assembly lengths as a best recommendation. However, due to the high possibility of variations to the steering mechanisms, it is always the responsibility of the installer to verify the suggested lengths will work for their particular installation. The manufacturer is not responsible for damage caused by incorrectly installed Wheel Angle Sensors. The installer takes responsibility for all risks from damage and injury when installing a Wheel Angle Sensor on a vehicle.

**Supported Vehicles**

The following models have been confirmed to be compatible with this Wheel Angle Sensor Kit:

<table>

Install Wheel Angle Sensor Brackets

The Wheel Angle Sensor needs to be connected to two points on the vehicle’s steering mechanism. One point is stationary and the other point moves as the steering mechanism turns from right to left. Follow the procedure to attach the Wheel Angle Sensor Brackets and Wheel Angle Sensor.

Install Wheel Angle Sensor Brackets

1. The Wheel Angle Sensor components are shown.
   (A) Wheel Angle Sensor
   (B) Wheel Angle Sensor Bracket
   (C) 3 spacer plates
   (D) Wheel Angle Sensor Linkage Rod
   (E) Linkage Rod
   (F) Linkage Arm Bracket

2. Find the Wheel Angle Sensor rear axle left side mounting location.

3. Secure the Wheel Angle Sensor bracket to the Final Drive support using the M24 x 50 bolts, M24 spring washers and three spacer plates as shown.

   **Note:** Discard the spacer plates if the Final Drive support is bolted to the axle extension using the top holes.
Install Wheel Angle Sensor Brackets

4. Tighten the bolts using a 36mm wrench.

5. The Wheel Angle Sensor Bracket is now mounted.

6. Mount the Wheel Angle Sensor to the bracket with the two kit provided bolts.

7. Tighten the bolts using a 9/16 wrench.
8. Mount the linkage bracket on the drag link arm as shown.

9. Mount the bracket using the M12 x 70 and M12 x 90 bolts, lower bracket, washers and nuts.

10. Tighten the bolts using a 19mm socket, ratchet and 19mm wrench.

11. The linkage Bracket is now installed.
Cut the Wheel Angle Sensor Rods to Length

The Wheel Angle Sensor rods are shipped longer than they need to be. These rods must be cut with a hack saw or other cutting device to the proper length to allow the linkage rods to allow the Wheel Angle Sensor to achieve the maximum number of counts as the steering wheel is turned from full right to full left.

**Note:** Due to the variability of the possible mounting positions, axle options, and wheel angle stops on the vehicle, it is the responsibility of the installer to verify the suggested lengths provided in this manual are correct for each individual installation prior to cutting the rods. Failure to verify the fit on your specific vehicle may cause damage to the Wheel Angle Sensor components or vehicle when the steering wheel is turned. This damage is not covered by warranty. Always verify the clearances prior to permanently cutting and connecting the Wheel Angle Sensor Rods to the Wheel Angle Sensor Brackets.

**Note:** Prior to cutting the rods, always mark the rods and temporarily connect them to the Wheel Angle Sensor Brackets. Manually position the steering mechanism at the full left and right positions and verify that if the rods were cut to the suggested lengths, nothing will be damaged. DO NOT CUT THE RODS UNTIL THE FIT IS VERIFIED.

*Figure 1* shows where to take the measurements for the Wheel Angle Sensor Rod and Linkage Rod. *Table 1* provides the typical rod lengths that work for most installations. Use these values as a starting point and adjust as needed for your specific installation.

**Note:** Secure the rods in a vice or other device while cutting. Protect the threads so they are not damaged. It is advisable to attach a nut on the side of the metal rod that is going to be kept in order to clean the threads after the cut has been made. Clean the ends of the threaded rods using a file and verify the threads are still good after cutting them.

*Figure 1*  **Wheel Angle Sensor Rod and Linkage Rod Cut Length Measurement Points**

*Table 1*  **Wheel Angle Sensor Rod and Linkage Rod Suggested Cut Lengths**

</tbody>
</table>
Use a hack saw to cut the linkage rod to length while it is held in a bench vise.

**Note:** Secure the rods in a vice or other device while cutting. Protect the threads so they are not damaged. It is advisable to attach a nut on the side of the metal rod that is going to be kept in order to clean the threads after the cut has been made. Clean the ends of the threaded rods using a file and verify the threads are still good after cutting them.

---

**Assemble the Linkage Rod Hardware**

After cutting the Linkage Rods to the proper lengths the ball joints and other hardware must be attached and prepared for the installation.

**Note:** Never connect and turn the steering wheel with the Linkage Rods connected until the fit has been verified.

---

**Assemble the Linkage Rod Hardware**

1. Attach a jam nut to the end of the Wheel Angle Sensor Rod (A).
2. Connect the Eye Connector to the end of the Wheel Angle Sensor Rod.
Assemble the Linkage Rod Hardware

3. Attach a jam nut to each end of the Linkage Rod (B).
4. Attach the ball joints to both ends of the linkage arm.

**Note:** The bolts for the ball joints should be pointing in the opposite direction as shown.

After assembling the Wheel Angle Sensor and Linkage Rods, use Figure 2 to determine the measurement points and *Table 2* for the suggested lengths of the rods for the final assembly.

**Note:** Always verify that the suggested measurements will work on your installation. These measurements are provided as a starting point only and must be adjusted at the time of the installation to ensure that nothing is damaged when the steering wheel is moved. DO NOT PERMANENTLY CONNECT THE RODS TOGETHER UNTIL THE FIT IS VERIFIED.

**Attach Wheel Angle Sensor and Linkage Rods**

The Wheel Angle Sensor Linkage Rod will be attached to the Wheel Angle Sensor and the Linkage Rod will be attached to the Linkage Rod Bracket. Do not attach the Wheel Angle Sensor Rod to the Linkage Rod until the fit has been confirmed and the steering mechanism has been manually checked at the full right and full left positions.
Attach Wheel Angle Sensor and Linkage Rods

1. Attach the Wheel Angle Sensor Rod to the Wheel Angle Sensor with the screw, washer, and lock nut that came with the assembly.

2. The rod will point forward.

   **Note:** It is important that the flat washer goes on the screw head side and **NOT** the nut side when attaching the arm.

3. Tighten the screw on the Wheel Angle Sensor shaft with a 1/8” Allen wrench and a 3/8” open end wrench.

   **Note:** The screws holding the potentiometer sensor to the top of the metal block should stick out from the bottom of the Wheel Angle Sensor assembly (shown by arrows). The Allen head should always be on the top of the sensor. The screws stick out on the bottom to prevent the sensor from being accidentally over extended by hand. Verify these screws are installed correctly and Wheel Angle Sensor Rod moves back and forth freely between the two screws at the bottom of the Wheel Angle Sensor block.

4. Attach the linkage rod to the linkage bracket. The bolt attaches to the top of the bracket and the nut and lock washer go on the bottom.

5. Tighten the ball joint to the bracket with a 1/2” and 9/16” open end wrenches.

   **Note:** Do not attach the Wheel Angle Sensor Rod to the Linkage Rod at this time. Make sure they are disconnected until after the maximum right and maximum left stops have been verified not to damage the assembly.
With the linkage rods disconnected, start the vehicle and manually turn the steering wheel so that the vehicle will travel straight ahead when moving.

Temporarily attach the Wheel Angle Sensor Rod and Linkage Rod together.

Rotate the Wheel Angle Sensor potentiometer on top of the mounting block so that the plastic wire connector is parallel to the Wheel Angle Sensor Rod.

After the potentiometer has been adjusted, tighten the potentiometer bolts with a 3/8” wrench and 5/32” Allen wrench.

Disconnect the linkage rods and then turn the steering wheel manually so the steering mechanism is turned to the full left position.

**Note:** The vehicle may need to be driven a short distance in order to get the steering system to move to the full left position.

Reattach the linkage assembly and verify that the sensor and linkage rods will not be damaged. Adjust the rod lengths as necessary.

Disconnect the linkage rods and turn the steering wheel manually so the steering wheels are turned to the full right position.

**Note:** The vehicle may need to be driven a short distance in order to get the steering system to move to the full right position.

Reattach the linkage assembly and verify that the sensor and linkage rods will not be damaged. Adjust the rod lengths as necessary.

Repeat Step 6 through Step 13 until the rod lengths have been adjusted and the potentiometer is centered to get the maximum sensor movement.
15. The maximum movement is reached when the Wheel Angle Sensor Rod will sweep from approximately 3/16” (5mm) from both bolt heads when the steering mechanism is turned to the maximum right and left positions.

**Note:** An Ohm meter can also be used to determine if there is enough sensor movement. Connect the Ohm meter to pins A and B of the Wheel Angle Sensor. Measure the Ohm reading at the maximum left and right position. After subtracting the smaller number from the larger number, there should be at least a 3.75 Kilo-Ohms change. The reading should also never go below 1.4 or higher than 6.0 Kilo-Ohms as this is reaching the limits of the potentiometer and could damage the sensor.

16. Once all the adjustments are complete, tighten all lock nuts and bolts on the Linkage and Wheel Angle Sensor Rods. A 1/2” and two 9/16” wrenches are required to tighten all the connections.

17. Tighten the two screws securing the potentiometer to the Wheel Angle Sensor, after final adjustments.

**Note:** Use a 1/8” hex key and a 3/8” wrench.
18. The Wheel Angle Sensor installation is now complete.
